You don't often get email from albeatrez@yahoo.com. [Learn why this is important](#)

Think Before You Click: This email originated **outside** our organization.

Hello Barb,

I've received sound level variance mailings for the bridge project because I own a home at 662 3rd St E. When the bus transit station was constructed on the same block, it included an inspection of the house before and after construction to ensure the building activity didn't affect the structure. I don't believe that project had much activity that would have affected the house. The bridge project on the other hand could impact the structure of buildings. My renters have commented on how they feel the impact and vibration of the work that is being done. Why wouldn't this project take the same approach and inspect the houses and or building in the general area? I look forward to hearing your thoughts

Thanks

Al Beatriz
